

BLUETOOTH® MESH

Johan Hedberg

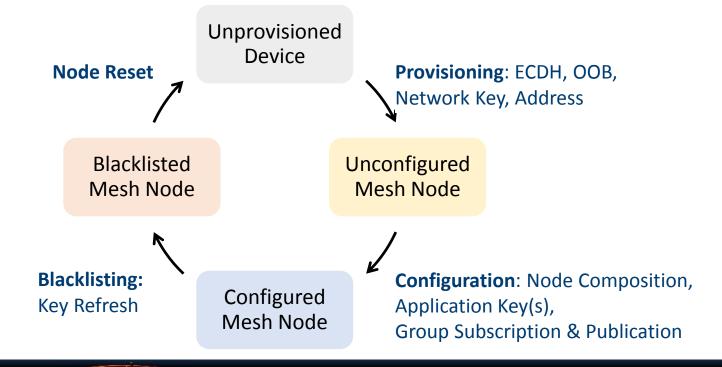

What is Bluetooth Mesh?

- New standard which came out in 2017
- Many-to-many, multi-hop topology
- No new Bluetooth HW required
- Broadcast & relay in a flooding/ripple fashion
- Mainly for signaling not large data transfer
- Message publication & subscription
- Multi-level security

Node Lifecycle

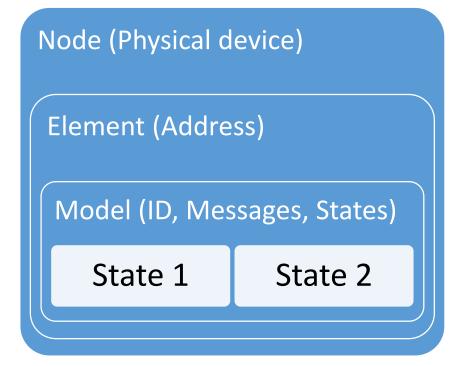

Node Composition: Elements & Models

Elements

- Unique Network Address
- Implements one or more Models

Models

- OpCode addressing
- States & Messages
- Client & Server

Mesh Protocol Layers

Models

Access Layer

Upper Transport Layer

Lower Transport Layer

Network Layer

Advertising Bearer

GATT Bearer (Optional) states / messages / behavior

opcodes, multiplexing models

heartbeat/friendship, application encryption & authentication

segmentation & reassembly

message format, network encryption & authentication

message transport

Relaying

- Time-to-Live (TTL, 7-bit, i.e. max 127)
- Decrypt with Network Key
- Decrement TTL

If TTL > 0:

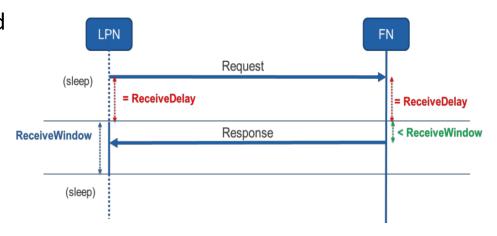

- Re-encrypt with Network Key
- Send out to Network
- Application layer payload remains encrypted & untouched
 - Relay Node may not even have the Application Key

Friendship

- 100% duty-cycle scanning needed for reliability, but consumes a lot of power
- Mix of battery & mains powered nodes
- Solution: pair up stable power supply nodes (Friends) with Low Power Nodes (LPNs)
- Friends queue up messages for the LPN
- LPN queries the Friend periodically if there are any messages for it

IMPLEMENTATION STATUS & PLANS

- Available starting with Zephyr 1.9
- All mandatory features implemented
- Tested against multiple other implementations
- Ported to MyNewt
 - Multiple valuable fixes ported back to Zephyr
- Demos possible with many popular supported Zephyr boards
 - Come to the Zephyr booth to see it in action!
- Minimum RAM footprint (entire OS with Mesh) is ~12kB
 - Fits even the most constrained 16k boards, like BBC micro:bit

- meshctl tool released with BlueZ 5.47
 - GATT Client
 - PB-GATT Provisioner
- Ongoing work both in user space (BlueZ) and kernel
 - Advertising & Scanning managed in the kernel
 - Controlled through mgmt API extensions
 - Essentially everything else in a user space meshd

Future development

- Mesh Vendor HCI Extensions
 - Supported both by Linux & Zephyr
- More features
 - Friend support for Zephyr
- More standard models
- More demos with various boards
